

Incident report analysis

Summary	A company experienced a DoS attack through an unconfigured firewall which allowed the attacker to send flood of ICMP packets which overwhelm the company's networks. The team responded by blocking ICMP packets, stopping all non-critical network services offline, and restoring critical network services.
Identify	A DoS attack through an unconfigured firewall which overwhelmed the company internal networks with ICMP packets.
Protect	The cybersecurity team implemented a new firewall rule to limit the rate of ICMP packets, source IP address verification for spoofed IP addresses, and IDS/IPS to monitor, filter and block traffic based on suspicious characteristics.
Detect	The cybersecurity team configured Source IP address verification on the firewall to check for spoofed IP addresses on incoming ICMP packets
Respond	The incident management team responded to attack by blocking ICMP packets, isolating affected systems and restoring essential network services. After containment the team performed root cause analysis and updated incidents response plan to protect the company from such incidents in future.
Recover	The network was fully restored after two hours of downtime. A post-incident review was conducted to strengthen policies, implement regular firewall audits, and test the resilience of backup systems. The organization also documented lessons learned and trained staff on future DDoS response procedures
